INTERPRETIVE COMMENTS

Mild normocytic anemia: Hemoglobin 11.1 g/dL and Hematocrit 33.5% are below the adult-male reference range, with normal MCV (88.6 fL). Differential is unremarkable; platelets and WBC within range. Recommend iron studies, ferritin, reticulocyte count, and stool occult blood given concurrent apixaban therapy. Correlate clinically with reported fatigue and dizziness.

Reference ranges per Mayo Clinic Laboratories (adult male). This report is for the use of the ordering provider only.
